Data Skylight™ for Snowflake - Solution Sheet
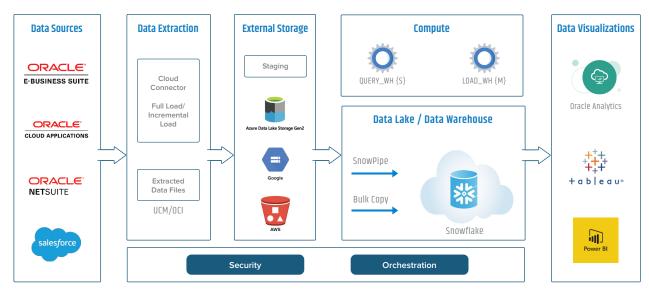

apps associates®

Business Challenge:

Most ERP Systems were built to process business transactions, not for reporting and analytics. Oracle Applications' users are looking for an easy-to-deploy solution to enable extraction of data from Oracle Cloud ERP for drill down analytics across multiple subject areas. Data Skylight for Snowflake, developed by Apps Associates, makes it quick and easy to configure and deploy a Cloud-based integration solution that enables companies to leverage the power of Snowflake, a market leading Cloud-based data platform, to analyze Cloud ERP data.

Solution:

Data Skylight for Snowflake was built to help customers extract value from their Oracle ERP data by harnessing the power of Snowflake. With over 20 years of working with Oracle Applications, we've pre-defined the business processes and data utilized by most businesses. Data Skylight for Snowflake removes the complexity associated with extracting data from Oracle Cloud ERP and automates the entire process - including the load into Snowflake. For each Oracle module, Apps Associates has predefined all the data that is typically required for analytics. End users can select just the subject areas they want to load into Snowflake or they can 'select all' and get all the data for the selected Oracle Module. From there, Data Skylight will do the rest. All the end user needs to do is start analyzing the Oracle Cloud ERP data in Snowflake - which is easy due to the data transformation logic built into Data Skylight for Snowflake by Apps Associates. Data Skylight supports ongoing incremental loads and near-real-time data latency. Data Skylight also supports Salesforce as a data source and the list of supported sources continues to grow.

Business Outcomes:

Reconcile data across multiple modules in the same report through access to most common information requests from HR, Finance, Supply Chain, Projects, and other modules

Speed to value - rapidly deploy Snowflake for analysis of Cloud ERP data

Refresh dashboards in real time to get the information you want, when you need them

Why this Solution:

Streamlines and automates the extraction process for Oracle customers with a templatized product designed specifically for Oracle Cloud ERP and Snowflake.

Untangle the complexities of Oracle Cloud ERP to reconcile data across systems, curate and clean the data in a centralized place, and self-generate dynamic reports and dashboards ad hoc on your timeline

Install and use in hours or days, not weeks or months

Solution Package

Data Skylight for Snowflake was built to see results in minutes. Upon a quick, initial consultation, the product specialist team can assist you in setting up select target and source connections, and then the tool will guide you through the selection criteria per business focus and subject area. The transfer process can take a matter of seconds or minutes to load depending on the amount of data being loaded into Snowflake.
